

# Conceptual Modeling of Life: Beyond the “Homo Sapiens”

ER 2016 - 11/14/2016

The 35th International Conference on Conceptual Modeling

*Oscar Pastor*  
*opastor@pros.upv.es*

Passion for Conceptual  
Modeling!!!  
I have had a dream...

(  
A world plenty of Conceptual  
Modelers  
species in our planet  
*Genius*

...our time unless thoroughly  
qualified. M. L. Barker. 1408 Chap-  
man Bldg.

## MEN WANTED

for hazardous journey, small wages,  
bitter cold, long months of complete  
darkness, constant danger, safe re-  
turn doubtful, honor and recognition  
in case of success.

Ernest Shackleton 4 Burlington st.

MEN—Neat-appearing young men of  
pleasing personality. between 25 and 40 to work

- to discuss the notion and the scope of CM
- to analyze how CM can help us to understand the world that comes (within what we could call a "social perspective")
- to analyze how CM can open promising and challenging scenarios in the domain of the genome understanding (a more “biological-oriented” perspective)

- What are the main inhibitors of modelling in practice?
- What could be done to improve the popularity of conceptual modelling in practice?
- What lessons did you learn from teaching conceptual modelling?

- What is an especially promising research direction in conceptual modelling?
- What is/should be the role of conceptual modelling in the digital transformation?
- What are especially promising areas of using models at runtime?

# What are the main inhibitors of modelling in practice (I)?

- Software Engineering is not really recognized in practice as a true engineering.
- More as a handicrafts-centered activity
- Strong dependence on skilled programmers

# What are the main inhibitors of modelling in practice (II)?

- Lack of a conceptual modeling perspective: product focus instead of process focus
- Conceptual Modeling on the top of Programming should be the basic topic in SE teaching
- Lack of a universal, widely-based, ontologically-supported definition

# What could be done to improve the popularity of CM in practice?

- Conceptual Programming (CP)-based tools
- Assess flexibility, efficiency and effectiveness of those CP-based tools
- Emphasizing the relevance of CM in Software Engineering teaching

# What lessons did you learn from teaching conceptual modelling?

- Big difference in CM abilities among students
- Or more precisely...lack of CM abilities !
- Should a Software Engineer be graduated without assessing a solid CM ability?

# What is an especially promising research direction in CM?

- Conceptual Modeling of Life
- The role of CM to guide/lead the digital transformation of our society
- From an Homo Sapiens to an "Homo Genius"

# What are especially promising areas of using models at runtime?

- Big Data is not Schemaless!
- Conceptual Modeling of the human genome and Precision Medicine implications
- Efficient and flexible Enterprise Modeling
- Full conceptual alignment between enterprise models and software application
- From Requirements to Code

Models, **Models**, Models...

**Sorry!**

**CONCEPTUAL MODELS, CONCEPTUAL MODELS,  
CONCEPTUAL MODELS...!!!**

1. What is a Conceptual Model?
2. Conceptual Modeling of Life: *the Social Perspective*
3. Conceptual Modeling of Life: *the Biological Perspective*
4. Why “*beyond the Homo Sapiens*”?
5. Clinical Applications: *Precision Medicine (PM)*
6. Conclusions

# What is a Conceptual Model?

A simplification of a system built with an intended goal in mind

An abstraction of a system to reason about it (either a physical system or a real or language-based system)

A description or specification of a system and its environment for some certain purpose

One main conclusion that we can reach is that the distinction between "model" and "conceptual model" is not always as precise as it should be.

# What is a Conceptual Model?

While much has already been written on this topic, there is however neither precise description about what we do when we accept this definition: endless model, nor rigorous description about of the relations among modeling artifacts (Muller, 2009) no consistent problem understanding of models (Ludewig, 2003)

- Back to the conceptualization human capability, we can see a CM as the result of making explicit a conceptualization process applied to a part of the world considered relevant for the conceptual modeler purpose

- The connection between the conceptual model and the corresponding software product that materializes it
- The CM is the code
- MDD / Conceptual Programming / CS-Centric Software Development / XNP...
- Conceptual Modeling is programming

# The CM discipline (Mylopoulos, 1992)

- The activity of formally describing some aspects of the physical and social world around us for purposes of understanding and communication. Conceptual modelling supports structuring and inferential facilities that are psychologically grounded. After all, the descriptions that arise from conceptual modelling activities are intended to be used by humans, not machines... The adequacy of a conceptual modelling notation rests on its contribution to the construction of models of reality that promote a common understanding of that reality among their human users..."

- CM is a widely applied practice and has led to a large body of knowledge on constructs that might be used for modeling and on methods that might be useful for modeling. Modeling is ruled by its purpose, e.g., construction of a system, simulation of real-world situations, theory construction, explanation of phenomena, or documentation of an existing system. Modeling is also an engineering activity with engineering steps and engineering results.
- Conceptual models are models that incorporate concepts or conceptions

- CM refers to the activity that elicits and describes the general knowledge a particular information system needs to know. Its main objective is to obtain that description, which is called a conceptual schema.
- Conceptual schemas are written in languages called conceptual modeling languages.
- CM is an important part of RE, the first and most important phase in the development of an IS

- If behind a CM there is a conceptualization process, the ontological perspective becomes a first-order issue to understand what CM is.
- In IS, ontologies are the basis for creating conceptual schemas, and the languages in which they are written are called conceptual modeling languages.
- This perspective provides a solid basis to link ontologies and CM, through the use of a foundational ontology

- ..to characterize the different sets of meta-ontological choices that can produce different types of conceptual models
- ..to understand what metaphysical choices are taken when a given foundational ontology is proposed (as these choices characterize the type of CMs that can be generated)

# Dimensions to classify types of conceptualizations

- Realism vs idealism
- Endurantism vs perdurantism
- Physical vs abstract objects
- Higher order types
- Possible worlds

- The application of meta-ontology to CM and IS development is still relatively underexplored, with a scarce literature.
- Useful to conduct comparative analysis of two or more FOs (and their subsequent CM languages).
  - to make explicit their theoretical differences,
  - to understand the different expressiveness of the resultant conceptual models
  - to investigate the implications of such differences on CM within IS development.

- ...to provide a precise view on what CM is
  - Ontologically-supported
  - Conforming a widely accepted body of knowledge, ER/CM leaded
  
- Word in progress by
  - Delcambre
  - Storey, Liddle, Pastor

- Assuming that our capability of conceptualizing is essential as it makes us -humans- different from any other species in our planet...
- How can conceptual modeling help us to understand and to improve the world that comes?

In a world heavily influenced by “doers”, just doing something without understanding with a sound conceptual basis why to do it and how to do it better, appears to be too often the selected approach

- What if sound CM-based were applied to first understand, later solve through a reasoned, conceptual agreement “big problems” as?
  - A CM of the European Union
  - Is Brexit good or bad?
  - Clinton vs Trump?
  - Should Scotland / Catalonia...become independents?
  - What is behind the social distortion and alineation of a suicide terrorist?

# Basic issues that create the context for the new world to come...

- **Hyperconnectivity**  
Conceptual Modelers should act as
- **Technological acceleration**  
the knowledge architects of relevant
- **Raising of world-wide emerging citizens,**  
data and information generated by  
this hyperconnected world,  
coming potentially from any country of the  
world and ready to consume and compete  
technologies in continuous evolution  
and reached by virtually all the  
human population.

- A sound process of conceptualization should identify the basic issues that lead the change,
  - to understand how they affect the current social context and...
  - to develop strategies to implement an accurate transformation
- CM should provide a solid basis to discuss and materialize the opportunities demanded by this new world that is coming.

- Need of strong conceptual support for essential concepts as context, adaptability, decision, luck, user experience, satisfaction, sustainability...
- Educating CM skills: a challenge to form citizens whose capabilities go beyond the Homo Sapiens traditional behavior

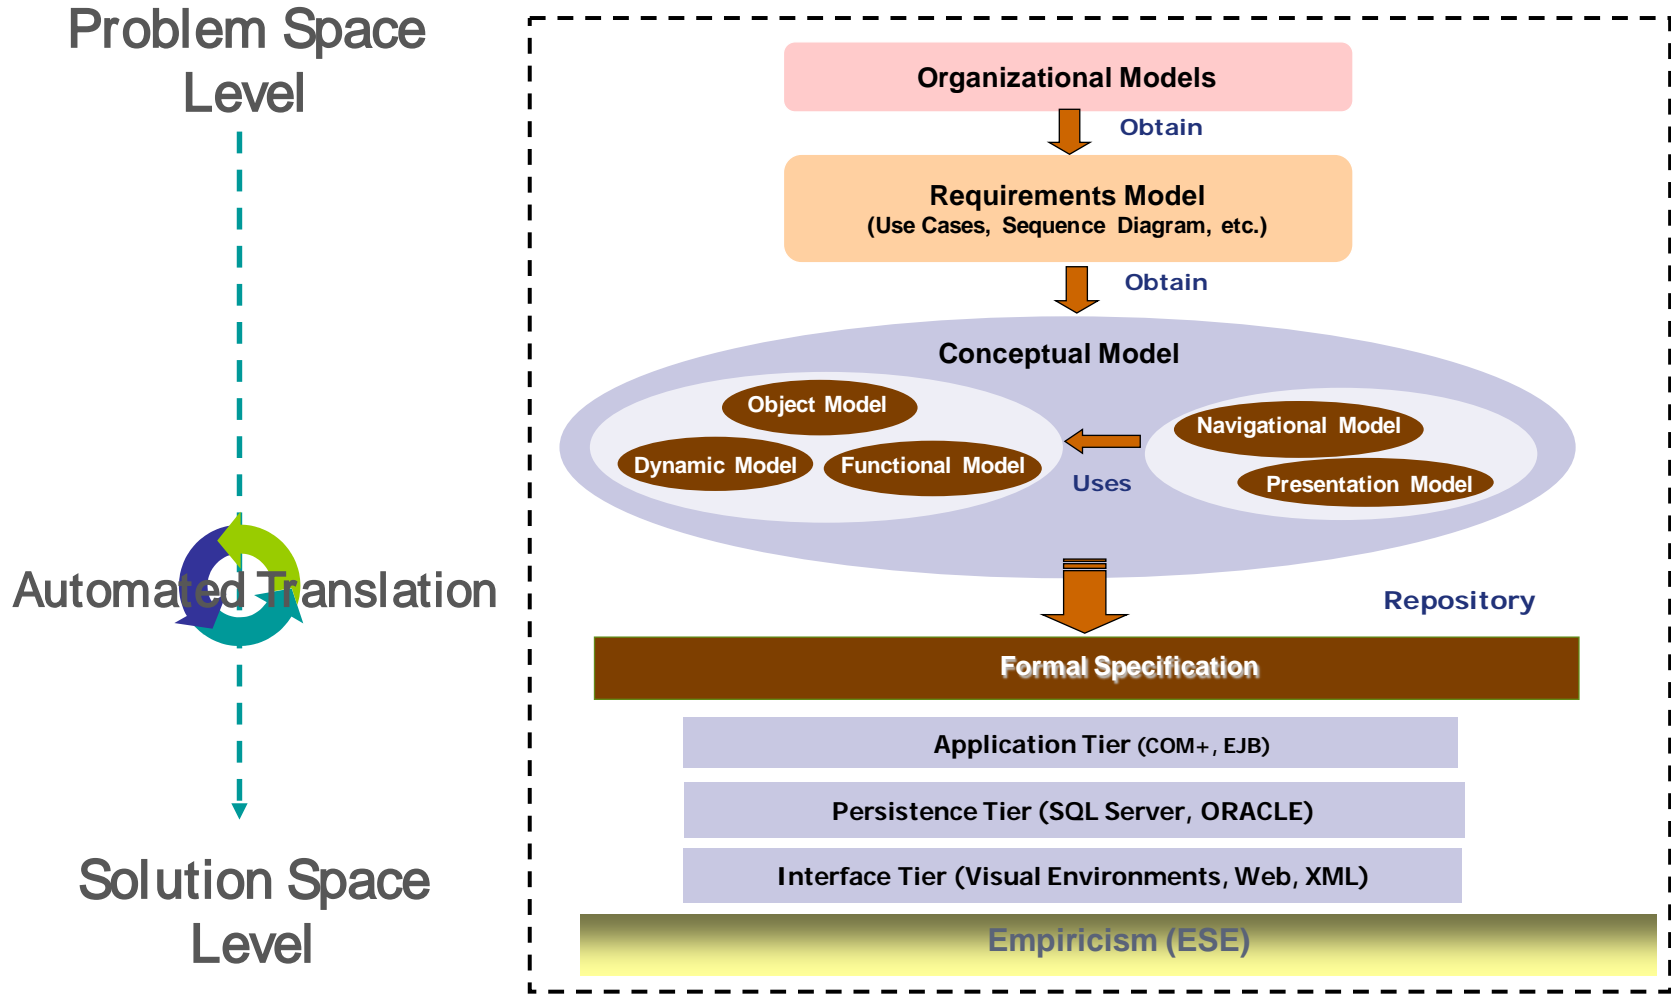

- Known knowns: expressible, articulated and relevant.
- Known unknowns: not expressible or articulated, but accessible and potentially relevant.
- Unknown knowns: potentially accessible but not articulated.
- Unknown unknowns: not expressible, articulated or accessible but still potentially relevant.

- And now, let's move to the biological perspective of the conceptual modeling of life...
  1. Experience in CM: the “move” to the Genome Understanding
  2. CM of the Human Genome
  3. Bio-implications and applications to the Medicine of Precision

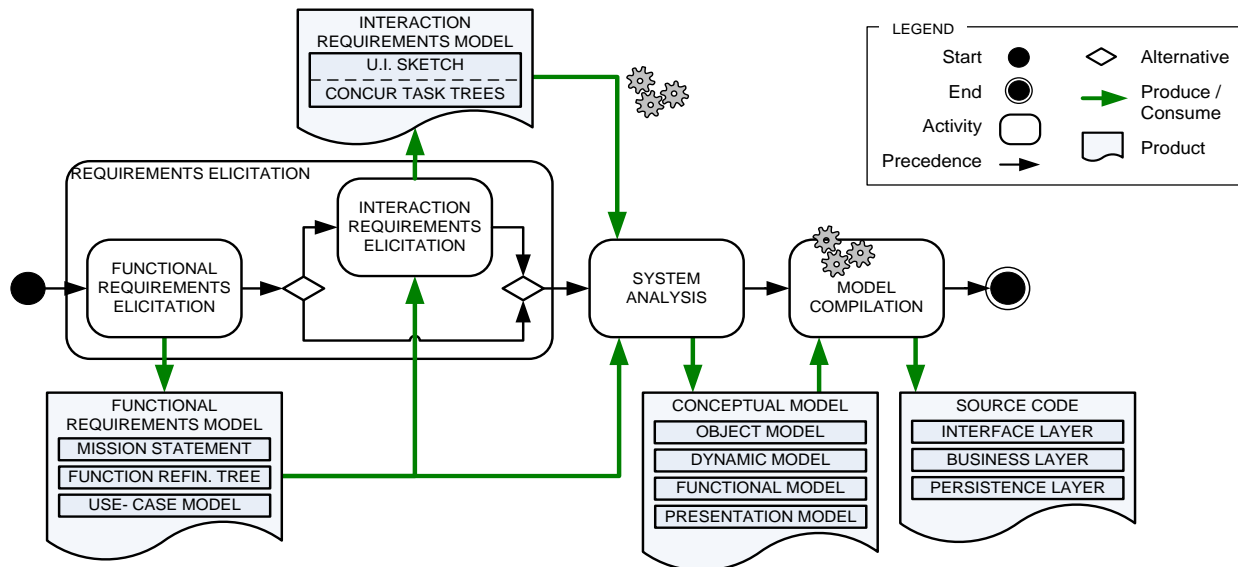

- We have been building
  - Traditional Information Systems
  - Web-based Information Systems
  - SOA-based systems
  - Pervasive Systems
- ...**but, what is next?**

# The OO-Method Approach

- We try to clarify our software development process
- Also, some gaps are being filled: an **Interaction Requirements Model** is being proposed, based on user-interface sketches that are supported a forest of task trees (ConcurTaskTrees notation)

## The Dream... (from Nicola Guerino, 2008)

An ontology-driven conceptual modeling system conceived as an extension of current tools such as IntegraNova, extended with

- ontological competence
- linguistic (terminological) competence
- capability to reason and criticize the designer's choice
- with reusability and understandability in mind.

# Which is the most complex system you can imagine?

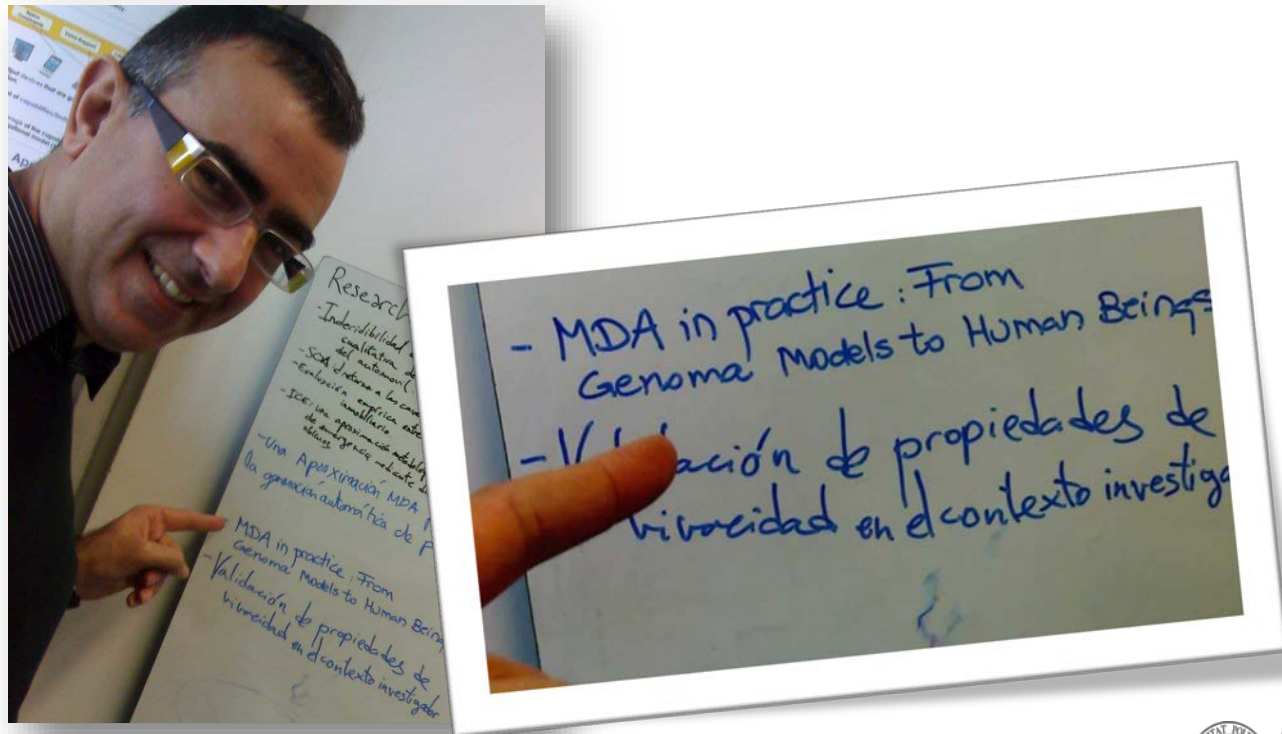

- Aircraft control?
- Weather prediction?
- Digital TV?
- Videogames?
- Web n.0 socio-geographical mashups?

- 
- A photograph showing two men from the side, looking at a large sheet of paper or whiteboard. The man on the left is wearing glasses and a dark shirt. The man on the right is also wearing glasses and a dark shirt, and he is pointing his right index finger towards the document. The document contains handwritten text in Spanish, including a section titled "Research:" followed by several bullet points. There are also some tables and a circled number "30" visible on the right side of the page. The background is slightly blurred, showing what appears to be a classroom or meeting room setting.

- Maybe, the **answer** is not so far from you...
- ..it is **you!!**

“A living organism is a **computer** or machine made up of genetic circuits in which DNA is the **software** that can be hacked.” — *Drew Endy, MIT*

# Human error

# Navigation through hyperlinks

# Data Quality Errors in Genomic Databases (Accuracy)

- Mostly found in primary databases (unreviewed data warehouses).
- SwissProt takes information from TrEMBL and when it is reviewed by experts any sequence conflict is annotated.
- Conflict annotations in the Human dataset: ~87%
  - Sequence conflicts: ~54%
  - Errors in sequence initiation: ~23%
  - Other errors: ~23%

# Data Quality Errors in Genomic Databases (Consistency)

- Genomic databases are very diverse, making integration a laborious process.
- Clasification of variations attending to the type:
  - Ensembl: 21 variation types.
  - dbSNP: 8 variation types.
  - UCSC: 3 variation types.
- Variation type name:
  - Ensembl: “Insertion”, “Deletion” and “Substitution”.
  - dbSNP: “DIV”
  - UCSC: “I”, “D” and “S”

# ClinVar Variant Interpretation Comparison

11% (12,895/118,169) of variants  
have  $\geq 2$  submitters in ClinVar

17% (2,229/12,895) are  
interpreted differently

# Open to Interpretation

Increasingly, genetic tests provide ambiguous results, leaving doctors and scientists searching to make sense of these 'variants of unknown significance.'

BY ERIC CELESTE

November 24, 2014 |  Print |  0 Comments

# Clinical Genetics Has a Big Problem That's Affecting People's Lives

Unreliable research can lead families to make health decisions they might regret.

For Heidi Rehm, it looked like a straightforward case. Her lab at Partners Healthcare offers tests for genetic diseases. They had received a blood sample from a fetus after a doctor conducting an ultrasound spotted signs of Noonan syndrome—an inherited disorder involving heart problems and stunted growth. The fetus turned out to have a mutation in PTPN11, a gene that affects the risk of Noonan syndrome.

Rehm found that another team of scientists had published on that very same mutation before. (Not every mutation of PTPN11 increases the risk of Noonan syndrome.) They found that it was more common among Noonan patients than in healthy people, and had billed it as “pathogenic”—that is, likely to cause disease. Rehm reported it as such to the doctor who sent her the sample.

Sometime later, she was listening to a talk by a colleague who had found the same mutation in a patient with Noonan syndrome and, based on the same published study, had also classified it as pathogenic. But this time, the patient—an adult—had contacted the researchers behind the paper. And they had admitted that their conclusions were wrong. In later work, they had found that the mutation is so common in certain ethnic groups that it couldn't possibly be responsible for a rare disease like Noonan syndrome. It wasn't pathogenic after all.

“I immediately contacted the physician to find out the story with that baby,” Rehm says. “And that's when I found out that the parents had terminated it.”

# Mother's Negligence Suit Against Quest's Athena Could Broadly Impact Genetic Testing Labs

Mar 14, 2016 | [Turna Ray](#)

NEW YORK (GenomeWeb) – Christian Millare had a severe seizure on Jan. 5, 2008, and died. He was two years old.

His mother Amy Williams is convinced, based on his medical records, the opinions of experts, and the published literature, that her son's life didn't have to come to such a premature end. Eight years later, Williams is suing Quest

Dia  
tes

In the complaint, Williams accuses Athena of misclassifying her son's SCN1A mutation as a variant of unknown significance (VUS), meaning that the lab determined there wasn't sufficient evidence in 2007 to link the mutation to epilepsy or determine it was benign. Williams asserts there was enough evidence at the time that her son's mutation was disease-causing. The complaint cites two papers, one published in [June 2006](#) and one published in [March 2007](#), which mention Christian's specific mutation had been studied and seen in another patient who had epileptic encephalopathy.

# Data, information or knowledge?

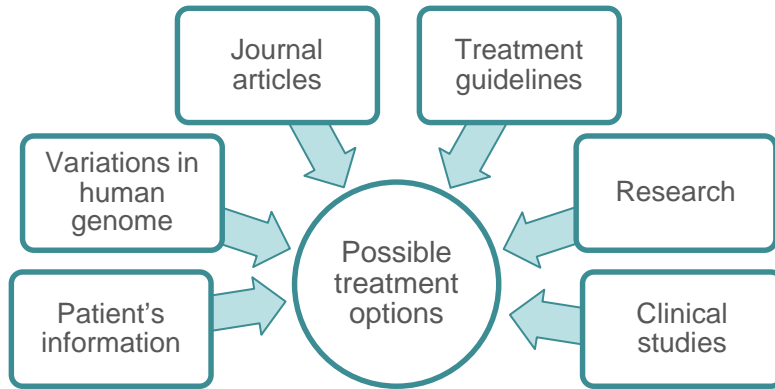

## More Data, Please

Oct 19, 2016

To tease out disease patterns, particularly for cancers, Mount Sinai's [Eric Schadt](#) tells [Wired](#) that data from many individuals is required — the more data, the more accurate any models are.

### IBM's Watson (from unstructured data)

Able to read scientific literature and interpret scans.

Tested at North Carolina Cancer Hospital:

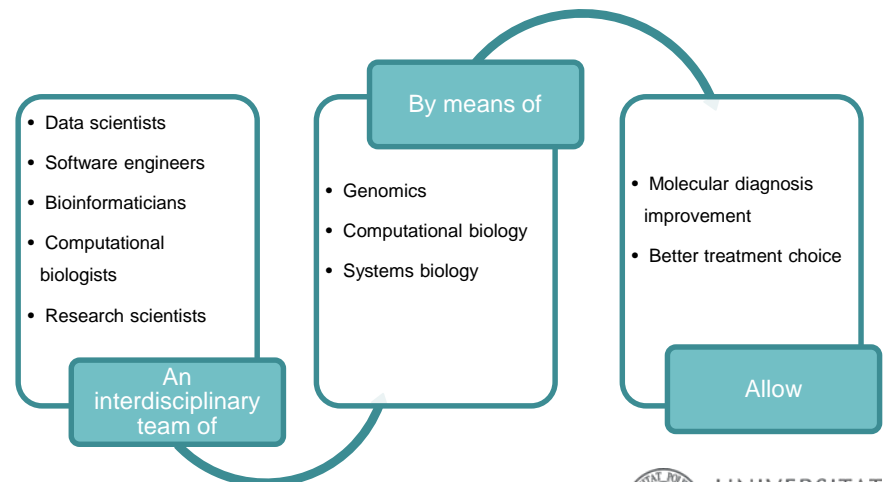

- 99% cases prescribed treatment within Watson's options
- 30% cases new treatment options not considered
- Timeline reduced from weeks to minutes!

# Dealing with genomic's Big Data

Medical data is expected to double every 73 days by 2020:

- How to clean, normalize, and manage large datasets?
- How to look for algorithmically interesting patterns?
- How to structure data that is unstructured?

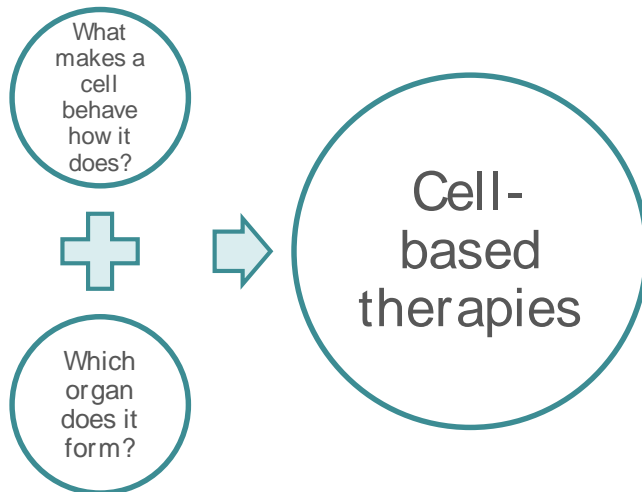

### Tempus (from structured data)

## Human Cell Atlas project

35 billion cells, 300 major types, many  
more subtypes  
ALMOST THE SAME GENOME!

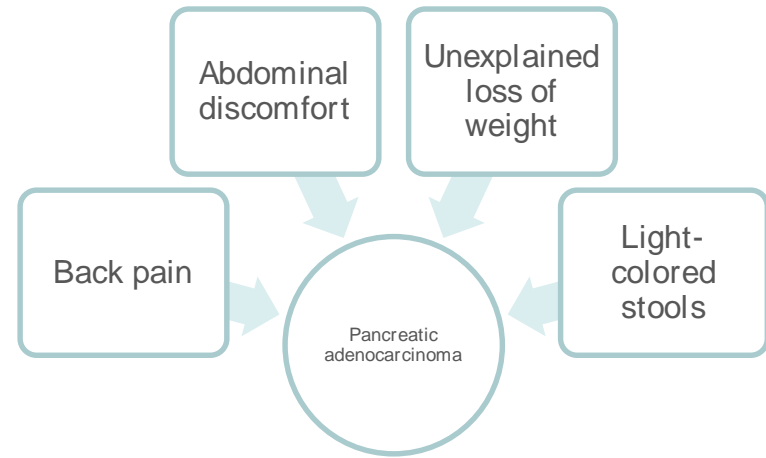

# Dealing with genomic's Big Data

*What if no biological data was needed at all?*

## Screening for Pancreatic Adenocarcinoma Using Signals From Web Search Logs: Feasibility Study and Results

John Paparrizos, MSc, Ryan W. White, PhD, and Eric Horvitz, MD, PhD

Search logs as sensor!

Human Genome Variation Society (HGVS) variant nomenclature format:

<sequence file identifier>:<type of reference sequence>.<position><change>

Different representations  
are sometimes possible

Automatically matching variations  
against a database may not be trivial

Examples of ambiguities and problems:

- Many notations for the same variant
- Software ignoring the guidelines
- Discrepancies turn into bugs

Ref: GAAC      Alt: GTTC

g.2\_3delinsTT/ g.2\_3inv

GRCh37 (3,137,144,693bp)

GRCh38 (3,238,442,024bp )

- The problem is getting worse!!!!
- The DNA Sequencing hardware is evolving dramatically
- In next years, we will be able to sequence a complete human genome faster and cheaper

	2003	2006	2016
Technology	Sanger	Next generation	Next generation
Cost	\$3 billion	\$100000	\$1000 / \$6500
Duration	13 years	3 months	3 days / 26h

3,2 Gb (~20000 genes)  
3GB (899MB compressed)

Exome = 1%

32 Mb (85% known variants)

Clinical exome = 15%

4,8 Mb (3000 genes associated  
with Mendelian diseases)

To improve our DNA variation  
**knowledge** and variant  
classification **consistency**, a  
massive effort in **data sharing**  
will be required.

The genomic community needs to come together and develop its own standards to ensure safe and effective use of genetic and genomic medicine.

# Connecting Data in the Big Data World

## Centralized Database

Everyone submits  
data to a single  
central database

Examples:  
ClinVar,  
dbGaP, EGA

## Centralized Hub

APIs connect each  
database to a  
central hub

Example:  
Many commercial  
platforms

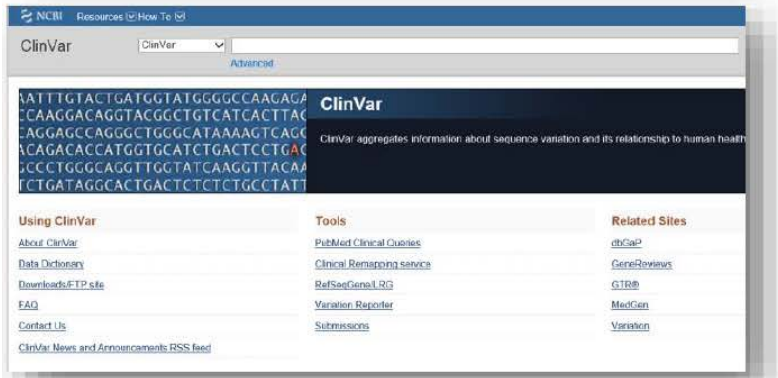

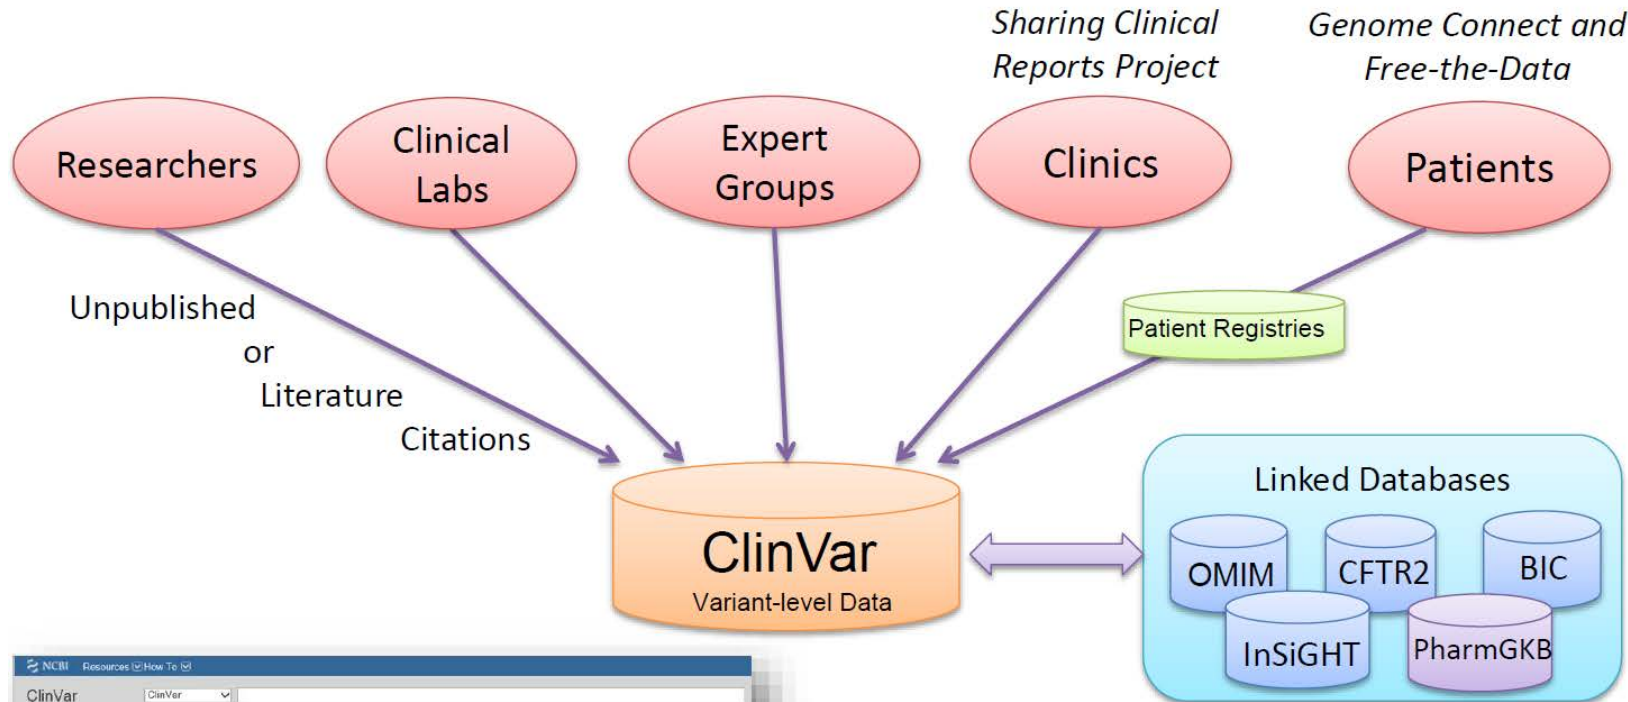

## Federated Network

All databases  
connected through  
multiple APIs

Example:  
Matchmaker  
Exchange

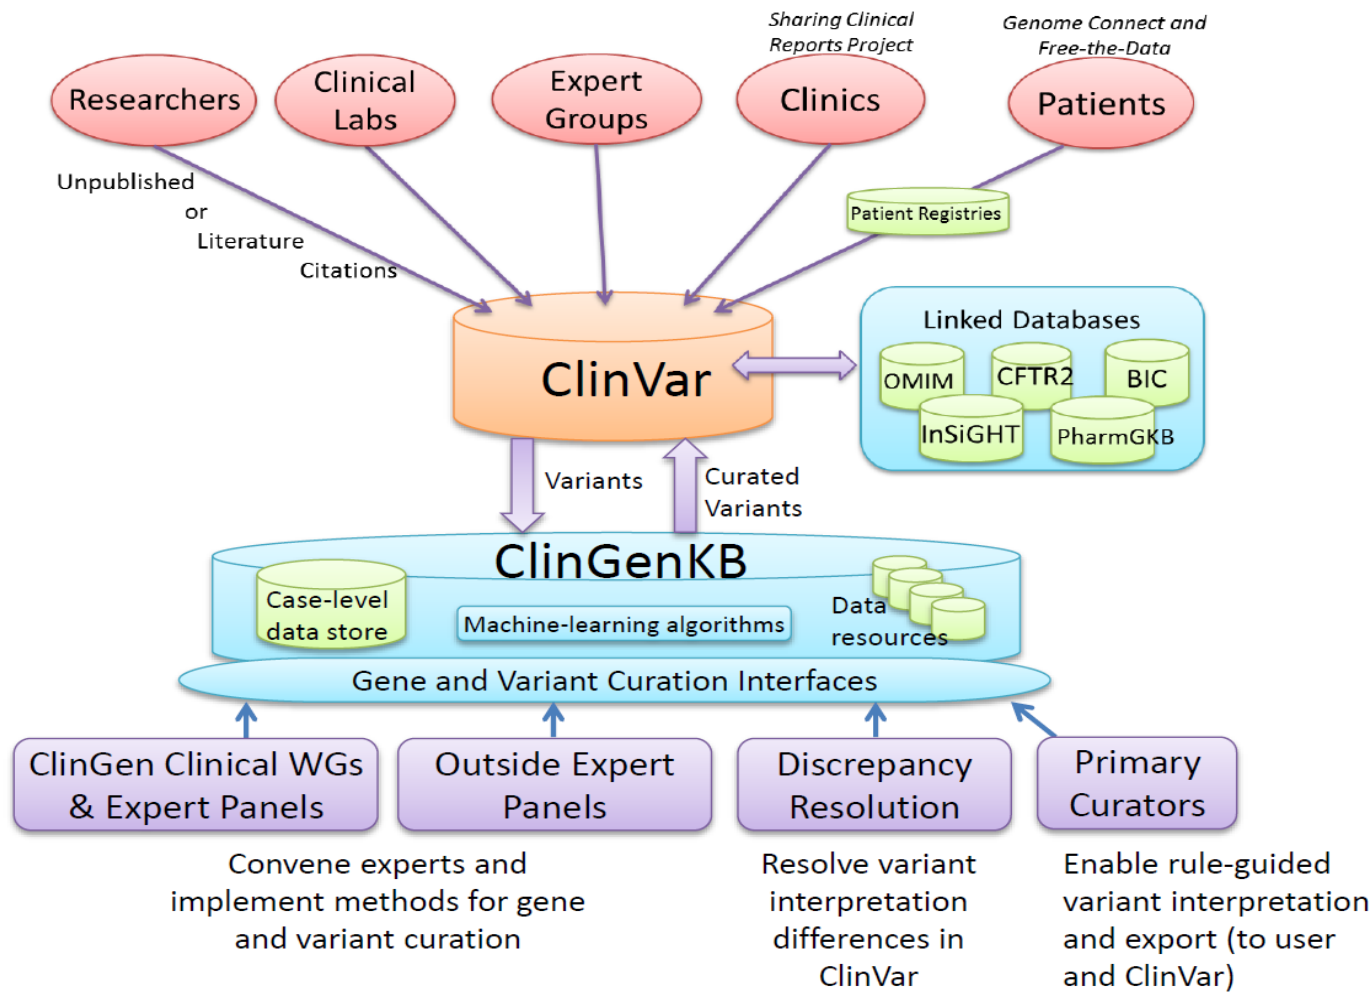

# Aggregating Variant Interpretations in ClinVar

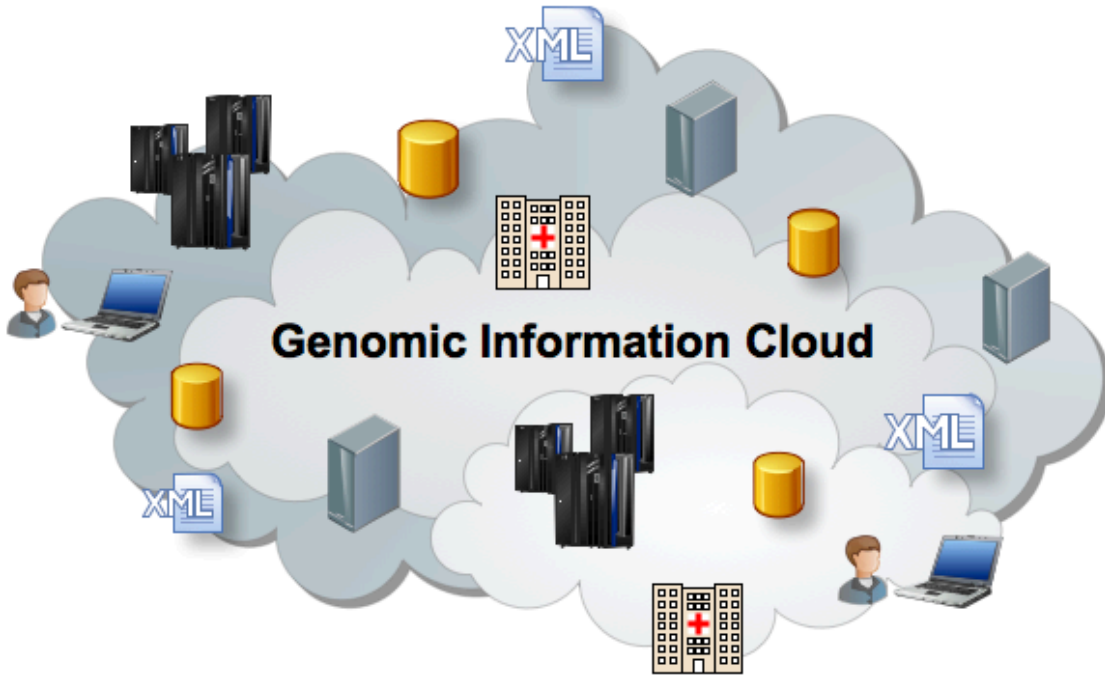

482 ClinVar submitters  
179,845 variants submitted  
126,247 unique interpreted variants

*ClinVar as of March 21. 2016*

# **P R O S** Genoma Project

# Variation Analysis Process

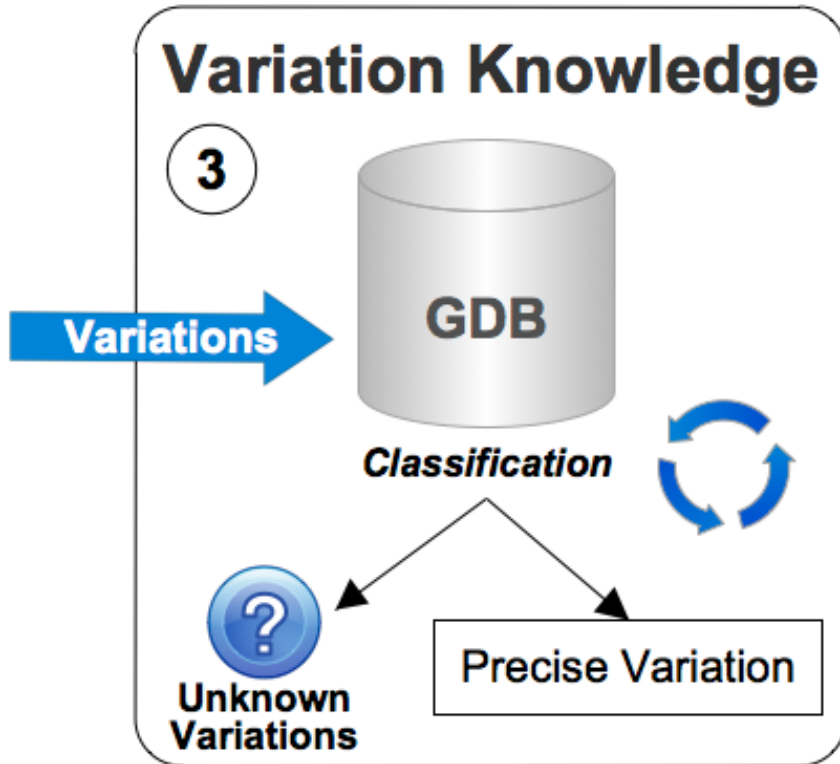

The Input of the process is a DNA sample from a sequencing machine and an allelic reference sequence.

An alignment is performed using the BLAST tool.

Each discovered difference is formalized as an instance of the variation entity. Then, a summarized report is generated.

# Variation Analysis Process

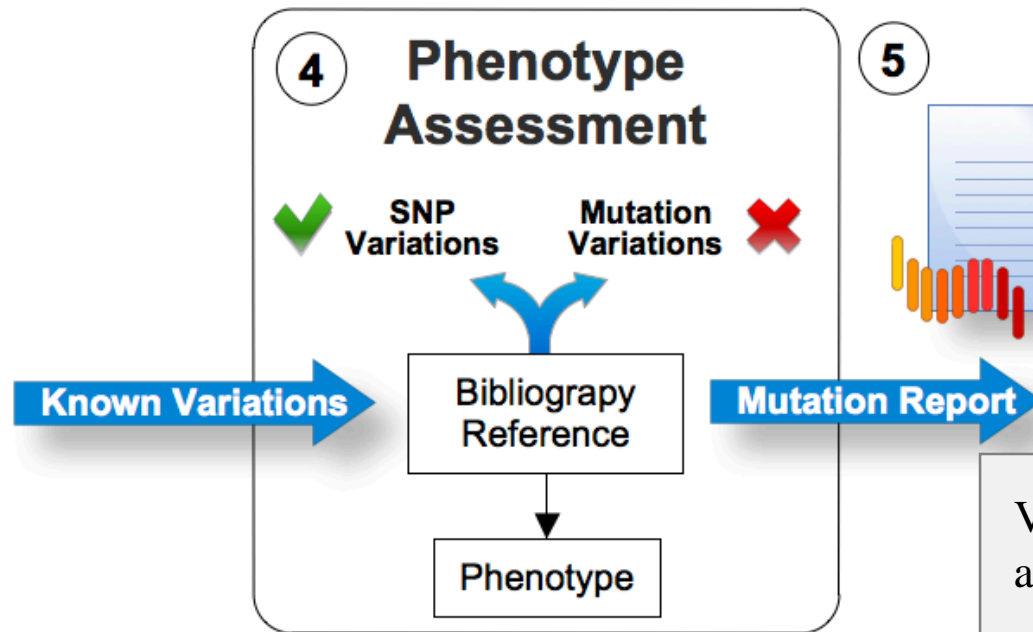

Found Variations are searched in a database conforming to the genome conceptual model.

Known variations are classified into a specific type of sequence change (Insertion, Deletion, SNP, Indel).

Unknown variations are classified as non-silent if the variation produces an effect in the expected gene product .

# Variation Analysis Process

In order to assess the phenotype of an specific variation, a research publication is required.

The conceptual model describes the bibliographical reference that supports the phenotype of a variation.

Variations with a pathogenic phenotype are classified as mutations

Finally, the information is gathered in a report to support the clinical diagnosis

# Analysis of 589,306 genomes identifies individuals resilient to severe Mendelian childhood diseases

PhD Thesis (José)

PhD Thesis (Ana)

PhD Thesis (Carlos)

PhD Thesis (Vero)

A man with dark hair, wearing a black long-sleeved shirt and blue jeans, stands in the foreground on a reddish-brown desert floor. He is smiling and has his hands clasped in front of him, holding a dark blue cap. A black backpack with blue straps is on his back, and a watch is visible on his left wrist. Behind him is a large, natural rock arch made of reddish-brown sandstone. Through the arch, a range of mountains with significant snow cover is visible under a clear blue sky. A few other people can be seen in the distance near the base of the arch.

I love to  
model!
